

Project Journal: Ops — Personal Life-Systems Engine

Udaypratap Singh

31 August, 2026

1. Project Overview & Technical Scope

Ops is a deterministic, constraint-based life-operating engine designed to replace traditional to-do lists with a single-user weekly scheduling canvas [?].

- **Core Unit:** 50-minute discrete focus blocks with built-in transition buffers.
 - **Key Capabilities:** Multi-pass deterministic constraint scheduler, energy-tiering constraints, and rolling weekly streak compliance metrics.
-

2. Summary of Work Completed

2.1 Architectural Specification & Non-Goals

- Defined commitment models: `FIXED_EVENT`, `RECURRING_QUOTA`, `FLEXIBLE_TASK`, and `HARD_DEADLINE`.
- Defined the non-punitive consistency formulation:

$$\text{Weekly Compliance Rate} = \frac{\text{Completed Sessions in Cycle}}{\text{Target Frequency Quota}} \times 100\% \quad (1)$$

3. Next Steps

1. Set up the SQLAlchemy 2.0 schema and Alembic migration pipeline.
2. Implement test suites for the standalone pure-Python constraint solver module.
